

WavPlayer is an easy-to-use PC based audio transcription software program with foot pedal. Offering compatibility with a wide selection of audio file formats, WavPlayer is designed to fit your needs.

Easy to Use

The WavPlayer is a PC based audio transcription software specifically designed for transcriptionists. Complete with a foot pedal that plugs directly into any serial or USB port of any PC computer, WavPlayer supports nearly all types of digital audio files. WavPlayer can also run in a minimized state so that you can type into the word processing software of your choice on the same computer. The foot pedal controls the play, pause, rewind and fast forward functions. The headset plugs into the standard audio jack of any computer.

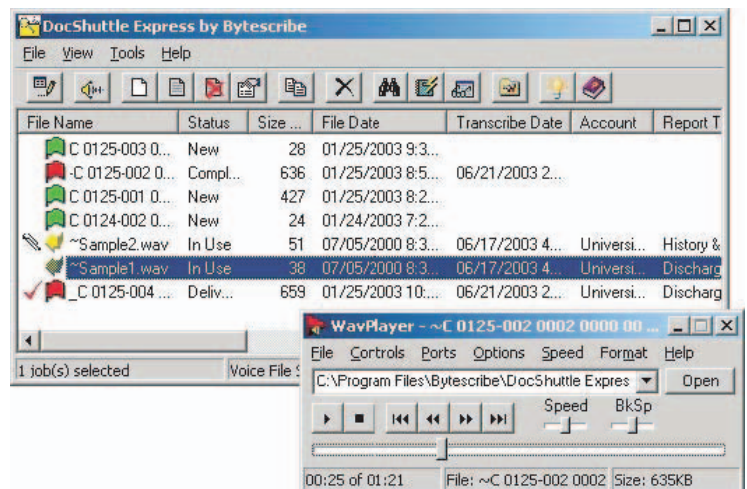

Track and Manage Files

DocShuttle Express guides the user through the transcription process of a dictation report. Double-clicking on a file in the DocShuttle Express window will move the report through each stage of the process. Clicking on a new file will load the voice file in WavPlayer and create a Microsoft Word document from a selected template. All header information is automatically merged into the document. The transcriptionist simply completes the Word document while listening to the voice dictation in WavPlayer. Once the Word document is completed, clicking on the same file in the DocShuttle Express window will export the completed document to a specified folder. The status of each job is updated during the process.

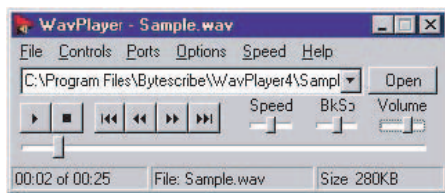

WavPlayer Features

- Speed and adjustable backspace controls.
- Support for most Windows sound file formats.
- History list of recently played sound files.
- Drop down list of recently selected sound files.
- Continuous rewind and fast forward.
- Improved tuning of speed, backspace and volume controls.
- Improved video support for .asf and other video formats.
- Popup menu when right-clicking in WavPlayer window.
- Internet streaming of sound files.
- Drag & Drop support for multiple files.

DocShuttle Express Transcription Software

Bytescribe WavPlayers comes with DocShuttle Express transcription software. This program is designed to manage voice files and text documents. DocShuttle Express works together with the Bytescribe-WavPlayer and MicrosoftWord to create a complete transcription environment. The software guides the user through the process of listening to dictation, capturing header information, creating Word documents from templates and exporting completed documents.

WavPlayer Software, Foot Pedal & Headset

USB Port Version:

USB (Universal Serial Bus) ports are available on most newer computers and generally have fewer compatibility problems than serial ports. USB ports are supported on Windows 98/ME/20-00/XP.

Serial Port Version:

Serial ports use an older technology, but are generally still available on most computers. Serial ports are supported on Windows 95/98/ME/2000/XP.
